

# Industrial Components

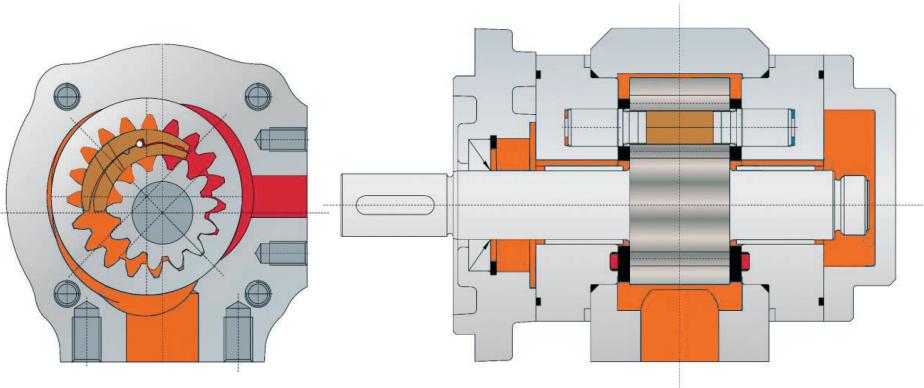

Internal gear pumps  
DHPC3, DHPC5, DHPC6

# Internal gear pump Type DHPC3 for industrial applications with constant displacement volume

## Characteristics

- Internal gear pump with axial and radial gap compensation
- Radial compensation with segments
- Suction and pressure port radial
- Field of application: Industrial hydraulic
- Low noise
- Long time life
- Low pulsation (pressure pulsation ~2 %)
- Multi flow combinations

\* Measured in anechoic room of Eckerle Hydraulic Division; Axial microphone distance 1.0 m

\*\* For acceptable pressure at 400–1.800 rpm. Further rpm on request.

\*\*\* Due to manufacturing tolerances the displacement volume could vary.

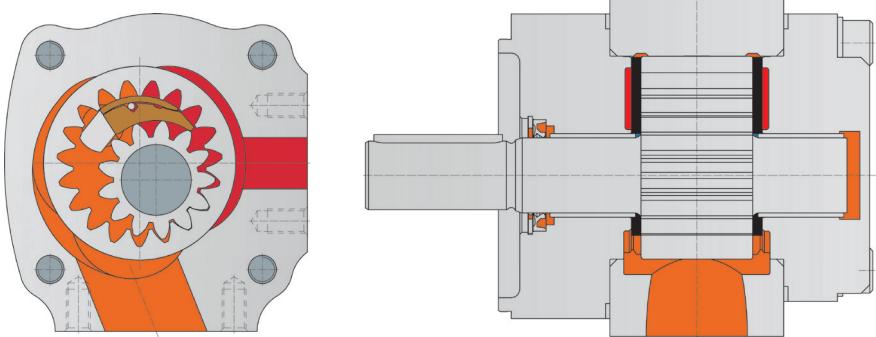

\*\*\*\* 2" suction port

The pumps have no corrosion protection. The max. permissible values must not be applied cumulatively. Please contact us.

# Internal gear pump Type DHPC5 for industrial applications with constant displacement volume

## Characteristics

- Internal gear pump with axial and radial gap compensation
- Radial compensation with segments
- Suction and pressure port radial
- Field of application: Industrial hydraulic
- Low noise
- Long time life
- Low pulsation (pressure pulsation ~2 %)
- Multi flow combinations on request

050	139,4	52,4	26,2	20

The single pumps of a multiple pump assembly are internally connected, even if you connect to the pump inlet.  
It is therefore no operating with different fluids possible.

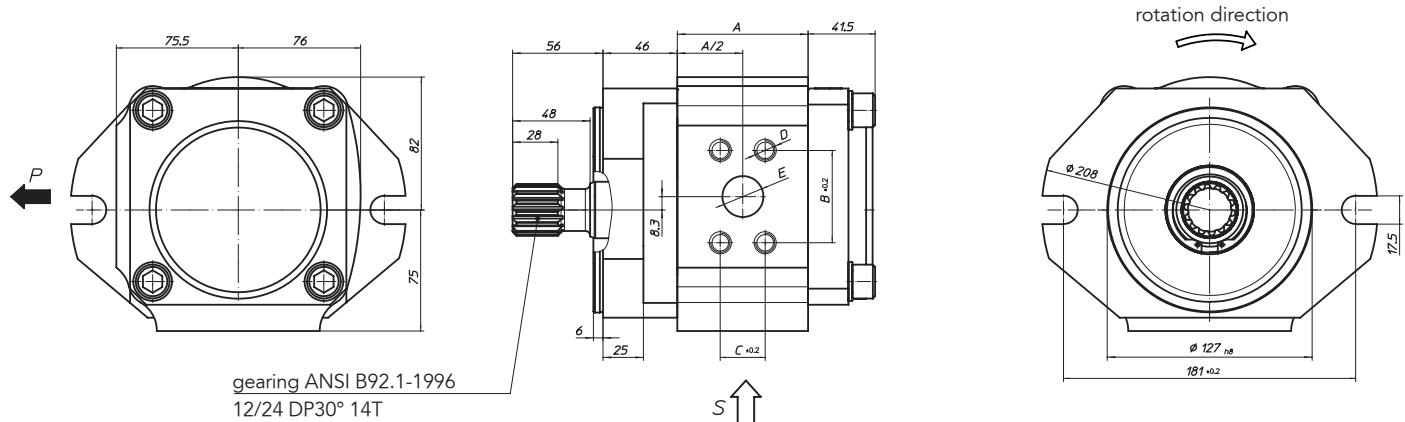

Pump with SAE-C-2-hole flange and cylindrical shaft  
Order example: DHPC5-\_\_RA23-1X

# Variable-speed operation DHPC

As a matter of principle, Dorninger Hytronics internal gear pumps are eminently suited for variable speed operation. Even at low viscosities and high temperatures of the pumping medium, the pumps run extremely energy efficiently and highly dynamically over a wide speed range due to the radial and axial gap compensation.

However, with variable speed operation certain boundary conditions should be observed. The exemplary cycle shown below illustrates this clearly.

## I. Start:

Dorninger Hytronics internal gear pumps are able to build up pressure from standstill. This happens smoothly when the pump starts from an unpressurized state. Please talk to Dorninger Hytronics, if due to the system design the pump is pressurized at standstill.

## II. Pump operation:

Dorninger Hytronics internal gear pumps are capable of providing a speed-dependent volumetric flow at any pressure level during pump operation. However, application limits of the respective sizes must be observed.<sup>2)</sup>

## III. Deceleration:

With Dorninger Hytronics internal gear pumps very high decelerations can be achieved. It must be ensured though that line-dependent pressure peaks can develop within the suction side. These should not exceed the maximum permissible inlet pressure.<sup>2) 3)</sup>

## IV. Pressure Holding Operation:

Dorninger Hytronics internal gear pumps are able to build up high pressures even at very low speeds due to the gap compensation. Hold pressure operation is thus extremely energy-efficient. Pump operation should follow after the hold pressure operation to flush out the pump.

## V. Reverse operation:

Eckerle internal gear pumps are usually able to run highly dynamically in the opposite direction of rotation in order to lower pressure peaks, or by means of a hydraulic motor. However, it must be ensured that the output pressure is always higher than the input pressure.<sup>1) 3)</sup>

## VI. Acceleration:

With Dorninger Hytronics internal gear pumps very large speed-ups can be run. These are limited by inlet pressure, geometry of the suction line and viscosity. However, these may not drop below the specified minimum inlet pressure of the series.<sup>1) 3)</sup>

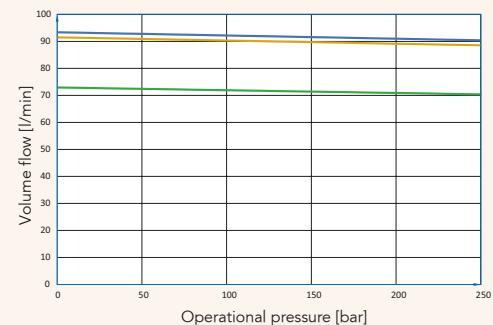

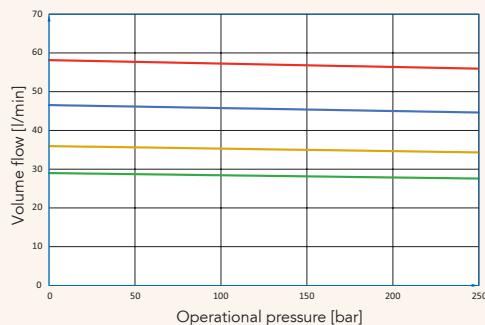

1) See Characteristics

2) See Technical data

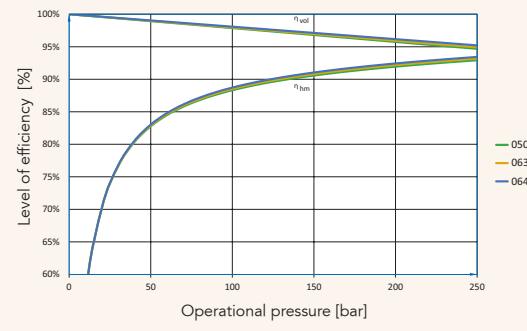

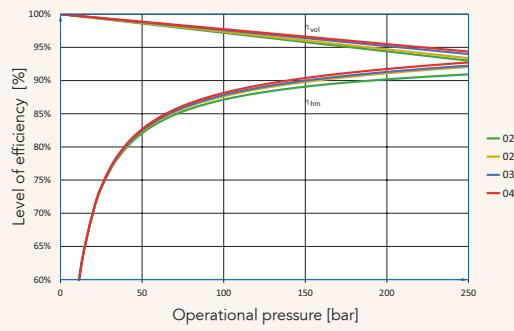

3) To avoid critical operating points, we recommend taking measurements of the pump's inlet and outlet pressure near the pump with a scanning rate of at least 1 kHz when a new pump cycle starts.
